Bonus Question

Question 1

- ① Use Union → The objective is to have a unique list of a customer who show up on both the Jan and Feb events. List should only appear once in the results.
Union removes duplicate rows across.

Question 2

- Use Union All → The goal is to count every individual transaction & records, including intentional or system driven repeats.
Union All repeats transactions they duplicated transaction as they want to account for every transaction.

Question 3

- x The Query fails - because the two tables don't have the same number of columns.

There is additional column named City which is not available at table 1.

This violates one of the core rules of union.

Every SQL statement being combined must return the same number of columns, in the same order, with compatible data type.
